

Introduction to R Statistical Software

Z Kelly

Joint Legislative Audit and Review Committee

Washington State Legislature

4/27/2016

Overview

- Background on R
- What can R do for you?
- Examples
 - File formats
 - Data management
 - Summary statistics
 - Visualization
 - Data analysis
- Advanced functionality
 - Markdown authoring
 - Rpres – HTML5 presentations
 - Shiny
 - LaTeX
 - Github
- Many, many other features
 - Scripting, C++, python, batch processing, geocoding, google maps, Markdown + CSS
- Suggested references

What is R?

- The fastest growing language on stack exchange

But is it ___?

- A calculator
- A *graphing* calculator
- A statistical reference

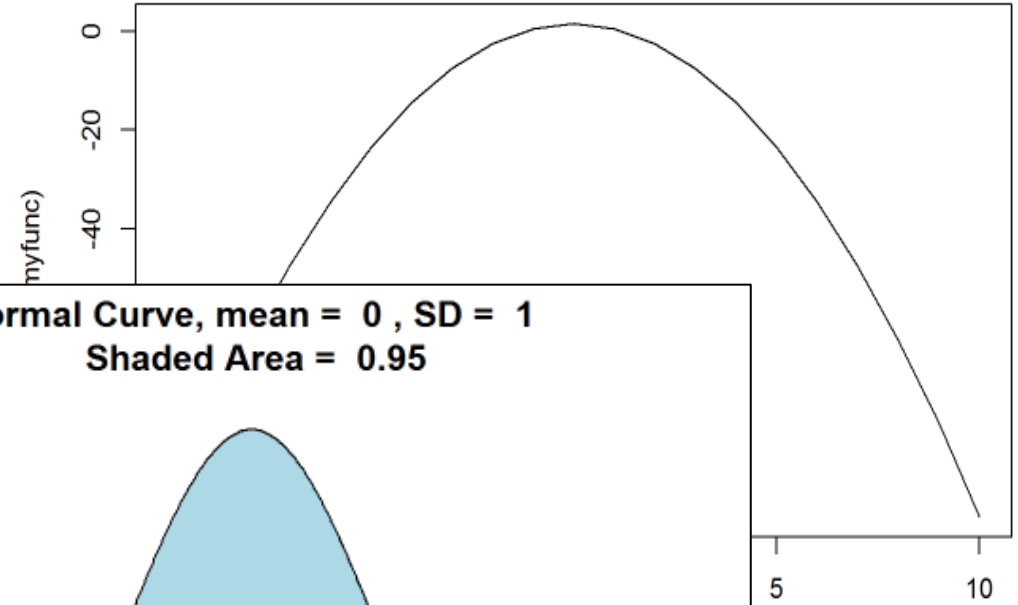

```
>> 2 + 2

## [1] 4

>> 2 * sqrt(pi)

## [1] 3.545
```

```
>> myfunc <- deriv(~1.5 - sqrt(x^4), "x")
>> x <- -10:10
>> eval(myfunc)
```

R is a language

- A language and a development environment
 - A full suite of tools for data manipulation, storage, operations, analysis, graphical display, and programming
 - Intended for all aspects of statistical analysis, broadly defined
 - Based on [S](#)
- Base R is easily extended by user-contributed modules called *packages* and it is easy to integrate C, C++, Java, Python, Ruby, Pearl, and more
- Distribution: [GNU GPL](#)

Considerations

- Complete suite of data tools
- Efficient functionality
- Nice graphics
- Well documented
- Large, helpful community; new packages added almost daily
- Price
- Learning curve
- What you see is what you get

Look and feel

Base installation

The screenshot displays the RStudio interface with the following components:

- Script Editor:** Contains R code for loading spatial data and creating a map.
- Environment Pane:** Shows the Global Environment with variables: Andrew (47 obs. of 8 variables), df (26 obs. of 7 variables), che (Large SpatialPolygonsDataFrame), dat (Large SpatialPolygonsDataFrame), M1 (List of 3), and plot (List of 9).
- Console:** Shows the execution of the script, including a warning message about unrecognized search fields and an error message: `Error in x[[1]] : subscript out of bounds`.
- Help Pane:** Displays the documentation for the 'dplyr' package version 0.4.3, including a list of links for description, guides, and code demos.

```
1 library(maptools)
2
3 dat <- readShapeSpatial("FireDist_2015.shp")
4
5 system.time(che <- readShapeSpatial("chelan_co_parcel/Parcels.shp",
6 delete_null_obj=TRUE))
7 system.time(plot(che))
8
9
10 library(googleVis)
11 data(Andrew)
12
13 M1 <- gvisMap(Andrew, "LatLong", "Tip",
14 options=list(showTip=TRUE, showLine=TRUE, enableScrollWheel=TRUE,
15 mapType='hybrid', useMapTypeControl=TRUE,
16 width=800,height=400))
17
18 plot(M1)
19
```

Warning messages:

```
1: In .HTMLsearch(query) : Unrecognized search field: title
2: In .HTMLsearch(query) : Unrecognized search field: keyword
3: In .HTMLsearch(query) : Unrecognized search field: alias
4: In .HTMLsearch(query) : Unrecognized search field: title
5: In .HTMLsearch(query) : Unrecognized search field: keyword
6: In .HTMLsearch(query) : Unrecognized search field: alias
>> gvisMap("Washington State")
Error in x[[1]] : subscript out of bounds
>> data(Andrew)
>> M1 <- gvisMap(Andrew, "LatLong", "Tip",
+ options=list(showTip=TRUE, showLine=TRUE, enableScrollWheel=TRUE,
+ mapType='hybrid', useMapTypeControl=TRUE,
+ width=800,height=400))
>> plot(M1)
>>
```

Documentation for package 'dplyr' version 0.4.3

- [DESCRIPTION file.](#)
- [User guides, package vignettes and other documentation.](#)
- [Code demos.](#) Use `demo()` to run them.

Help Pages

ABCDEFGHIJKLMNOPQRSTUVWXYZ

RStudio

What are packages?

- User-written functionality
 - Hosted on multiple mirrors worldwide
- Browse at: cran.r-project.org

Bayesian	Bayesian Inference
ChemPhys	Chemometrics and Computational Physics
ClinicalTrials	Clinical Trial Design, Monitoring, and Analysis
Cluster	Cluster Analysis & Finite Mixture Models
DifferentialEquations	Differential Equations
Distributions	Probability Distributions
Econometrics	Econometrics

Task view

The packages in this view can be roughly structured in

Basic linear regression

- *Estimation and standard inference* : Ordinary least squares and various methods such as `summary()` and `anova()`
- *Further inference and nested model comparison* (instead of F tests) and plug-in of other covariance structures and nonlinear hypotheses in `deltaMethod()` in [car](#).
- *Robust standard errors* : HC and HAC covariance matrices
- *Nonnested model comparisons* : Various tests for non-nested models is provided by [nonnest2](#) (and `sp`)
- *Diagnostic checking* : The packages [car](#) and [lmtest](#)

Microeconometrics

- *Generalized linear models (GLMs)* : Many start with particular logit and probit models for modeling binary [effects](#). Marginal effects: `margins` for certain GLM

Functions and Datasets to Accompany J. Fox and S. Weisberg, An R Companion to Applied Regression, Second Edition, Sage, 2011.

High standard for
documentation

Version: 2.1-2

Getting data into R

- Base R can read many file formats
 - “read.csv”
 - “load” – for .Rdata format
 - “readLines” – generic
 - “url” – to open a connection
- Many contributed packages extend functionality
 - “readSpatialPolygons”
 - “readHTMLTable”
 - Database drivers – SQLite, MongoDB, etc...

Analysis

Describing data

Summarizing the dataset

```
data <- gss08
dim(gss08)

[1] 2023  12

names(gss08)

[1] "sex"      "race"     "degree"   "relig"    "polparty" "cappun"
[7] "tvhours" "marijuan" "owngun"   "gunlaw"   "age"      "chldidel"

str(gss08)

'data.frame':  2023 obs. of  12 variables:
 $ sex      : Factor w/ 2 levels "Female","Male": 2 2 2 2 1 2 1 1 1 1 ...
 $ race     : Factor w/ 3 levels "AfrAm","Other",..: 2 2 1 1 1 1 1 1 1 1
 $ degree   : Factor w/ 5 levels "Bachelor","Graduate",..: 3 2 3 3 3 1 3
```

Summarize variables

```
summary(gss08)
```

degree		relig	
Bachelor	: 355	Catholic	: 470
Graduate	: 194	Jewish	: 39
HighSchool	: 1003	None	: 332
JunColl	: 173	Other	: 133
NotHs	: 297	Protestant	: 1040
NA's	: 1	NA's	: 9

tvhours	marijuan	owngun	
Min.	: 0	Legal :496	No :870
1st Qu.:	1	NotLegal:751	Yes :464
Median	: 2	NA's :776	NA's:689
Mean	: 3		
3rd Qu.:	4		
Max.	:24		
NA's	:699		

Data: General Social Survey 2008

What's the pattern of missing responses?

One option: w

```
apply(gss08, 2,
```

\$sex

FALSE
2023

\$race

FALSE
2023

```
library(VIM)
```

```
histMiss(gss08[, c("age", "cappun")], border = NA)
```

Tabulating data

Base R functions: “table” and “ftable”

```
>> ftable(table(gss08$sex, gss08$polparty,  
gss08$cappun, useNA = "ifany"))
```

```
##                Favor Oppose  NA  
##  
## Female Democrat    203    200  19  
##             Independent 217    123  41  
##             Other        3      5   0  
##             Republican  206     54  13  
##             NA           3      3   4  
## Male  Democrat    169    118  12  
##             Independent 240     99  26  
##             Other        19      9   2  
##             Republican  200     28   4  
##             NA           3      0   0
```

Many others: “htmlTable”, “xtable”,
“stargazer”, “Hmisc”, “**printr**”

```
>> kable(x, caption = "A table produced  
by kable.")
```

A table produced by kable.

	Female	Male
Democrat	422	299
Independent	381	365
Other	8	30
Republican	273	232

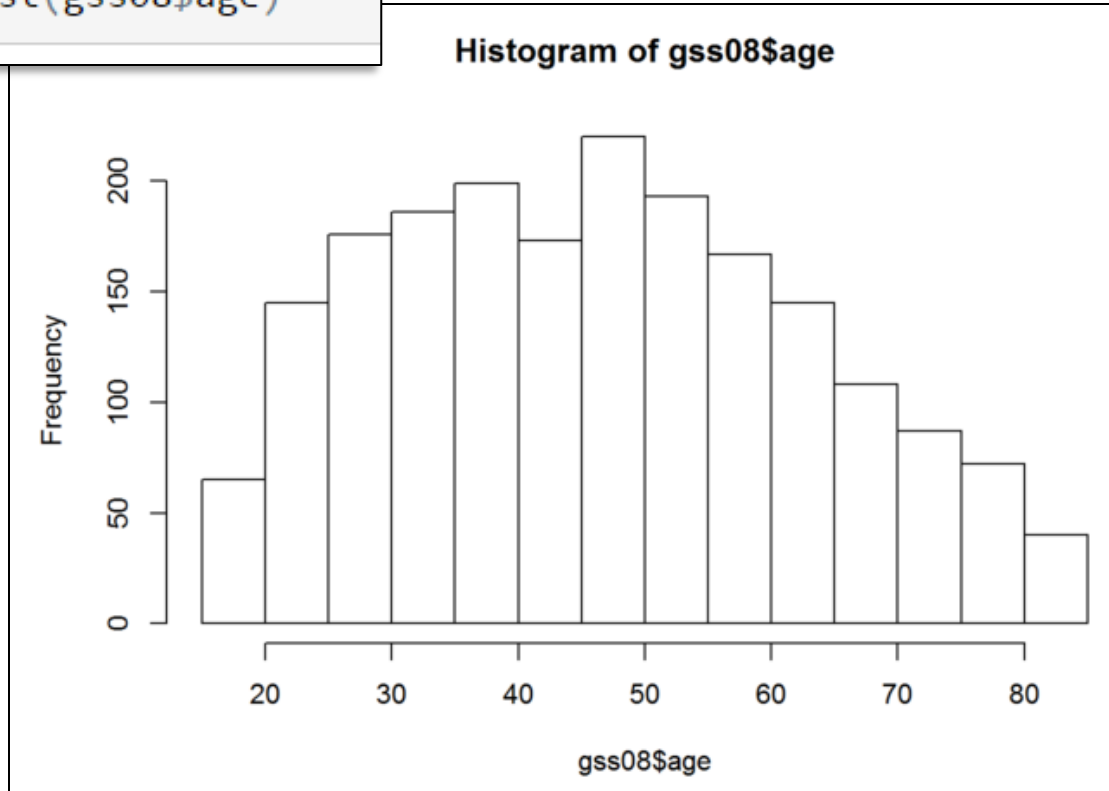

Descriptive plots

- Again, many options (beyond base R)
- Ex: from “Hmisc”
 - Calls several functions, nested together

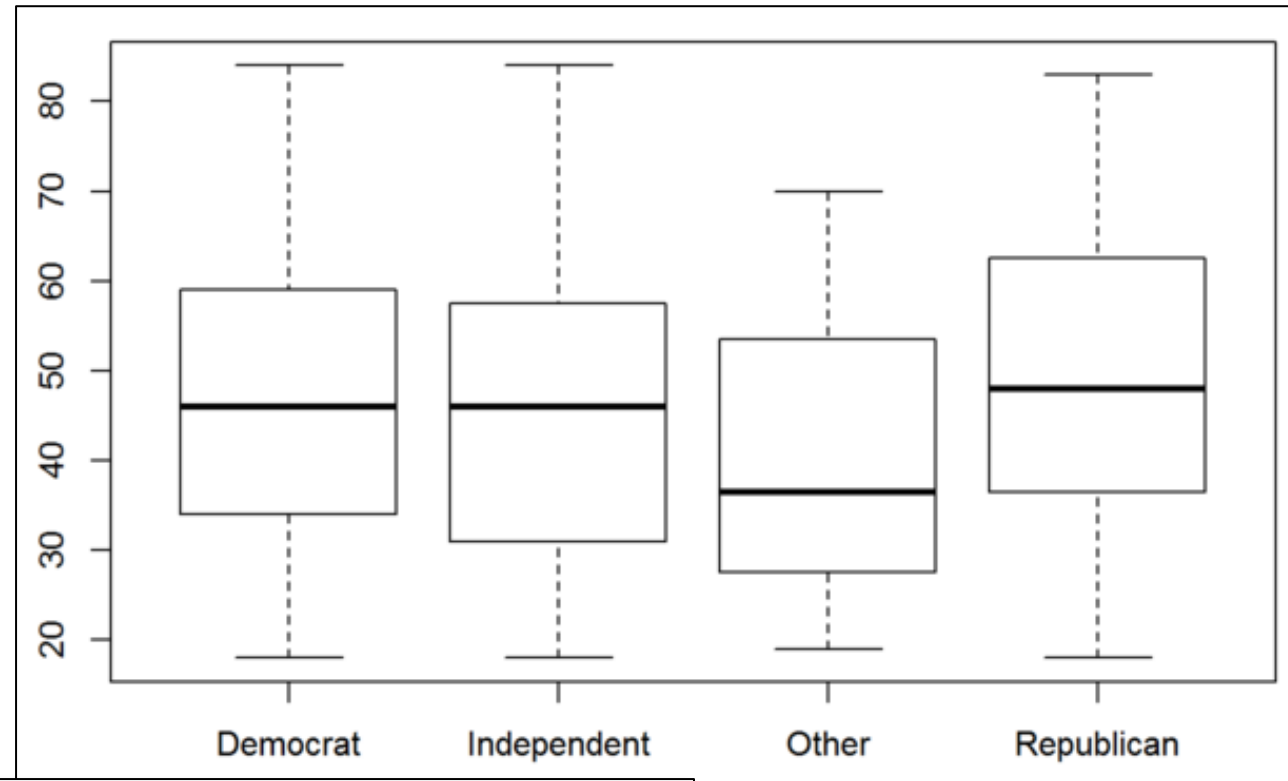

```
plot(summary(tvhours ~ cappun, data = gss08))
```

```
# base R histogram  
hist(gss08$age)
```

But default plotting methods
produce simple graphics

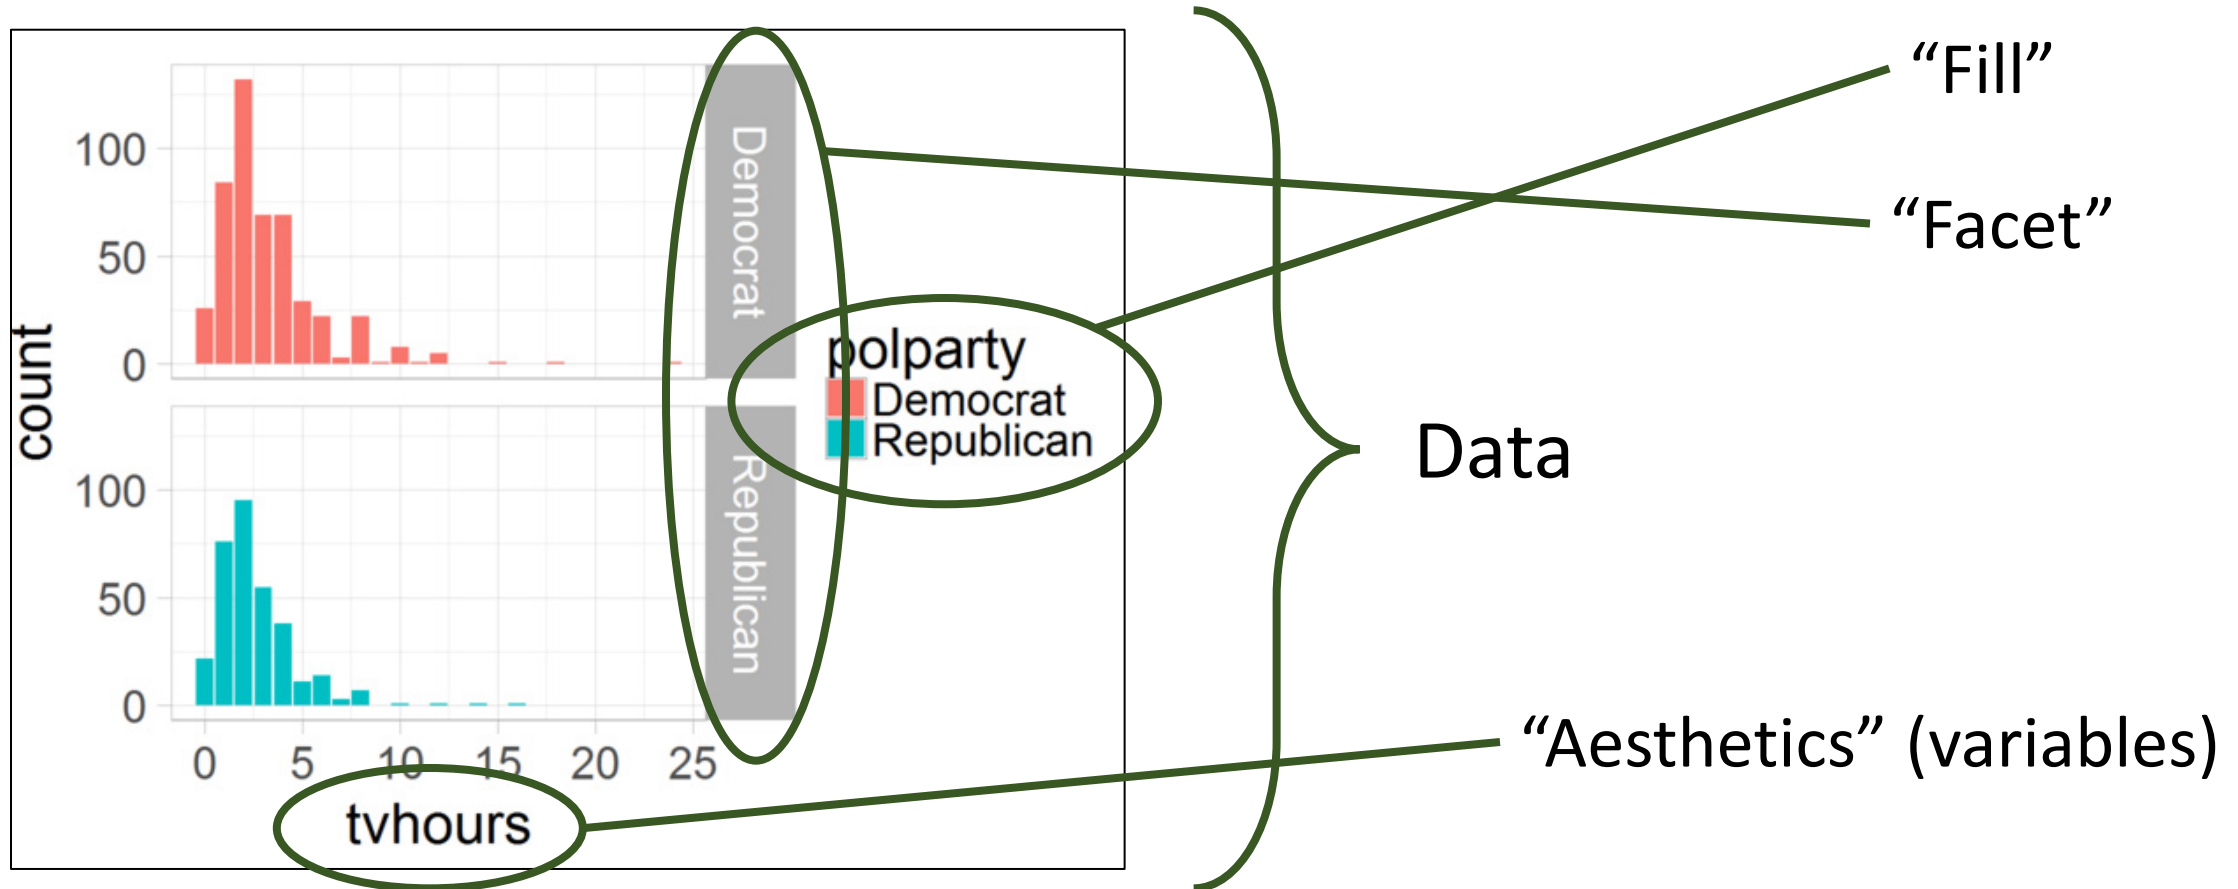

Base R is very efficient for
making such plots

```
boxplot(gss08$age ~ gss08$polparty)
```

Descriptive plots, cont.

- The most popular options for high-quality graphics are “lattice” and “ggplot2”
 - Sidenote: ggplot2 and the “grammar of graphics” (very, very quickly)

More descriptive plots

```
x <- gss08[!is.na(
ggplot(data = x) +
  theme_light(bas
  labs(fill = "Pa
```

Party
Democrat
Independent
Other
Republican

Statistical tests

- Far too many to list here
 - T-tests, X^2 , rank-sum tests, Anova, unit-roots, etc...
- Examples:
 - Does opinion on legal marijuana by political party?
 - What about average hours of TV viewing?
- If there's a test you'd like to perform, it's probably already implemented somewhere

```
t <- table(gss08$polparty, gss08$marijuan)
chisq.test(t)
```

Pearson's Chi-squared test

data: t

X-squared = 30, df = 3, p-value = 0.0000004

```
x <- dplyr::filter(gss08, polparty == "Democrat" | polparty == "Republican")
t.test(tvhours ~ polparty, data = x)
```

Welch Two Sample t-test

data: tvhours by polparty

t = 4, df = 800, p-value = 0.0005

alternative hypothesis: true difference in means is not equal to 0

95 percent confidence interval:

0.262 0.923

sample estimates:

mean in group Democrat mean in group Republican

3.21

2.62

Statistical Modeling

- Almost every type of modeling uses a common *formula* style

$$Y \sim V ar_1 + V ar_2 + \dots$$

- Bivariate/multivariate models easily implemented
 - Use “summary()” or “print()” to see the results
 - Several packages exist for creating nicely formatted regression tables and plots

ANOVA

Example:

- First run ANOVA with TV hours as dependent variable
- Then, run Tukey's honest differences test

```
fit <- aov(tvhours ~ polparty + sex + degree, data = gss08)
summary(fit)
```

	Df	Sum Sq	Mean Sq	F value	Pr(>F)	
polparty	3	99	32.9	5.08	0.0017	**
sex	1	12	11.5	1.78	0.1819	
degree	4	766	191.4	29.58	<2e-16	***
Residuals	1309	8471	6.5			

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

705 observations deleted due to missingness

TukeyHSD(fit)

Tukey multiple comparisons of means
95% family-wise confidence level

Fit: aov(formula = tvhours ~ polparty + sex + degree, data = gss08)

\$polparty

	diff	lwr	upr	p adj
Independent-Democrat	-0.161	-0.581	0.2597	0.759
Other-Democrat	-1.341	-2.739	0.0557	0.065
Republican-Democrat	-0.593	-1.064	-0.1213	0.007
Other-Independent	-1.181	-2.577	0.2149	0.130
Republican-Independent	-0.432	-0.899	0.0350	0.082
Republican-Other	0.749	-0.663	2.1608	0.522

\$sex

	diff	lwr	upr	p adj
Male-Female	-0.186	-0.461	0.0891	0.185

\$degree

	diff	lwr	upr	p adj
Graduate-Bachelor	-0.245	-1.029	0.539	0.913
HighSchool-Bachelor	0.831	0.295	1.368	0.000
JunColl-Bachelor	0.326	-0.466	1.119	0.794
NotHs-Bachelor	2.339	1.653	3.025	0.000
HighSchool-Graduate	1.077	0.390	1.763	0.000
JunColl-Graduate	0.572	-0.329	1.473	0.414

Factor Analysis/PCA

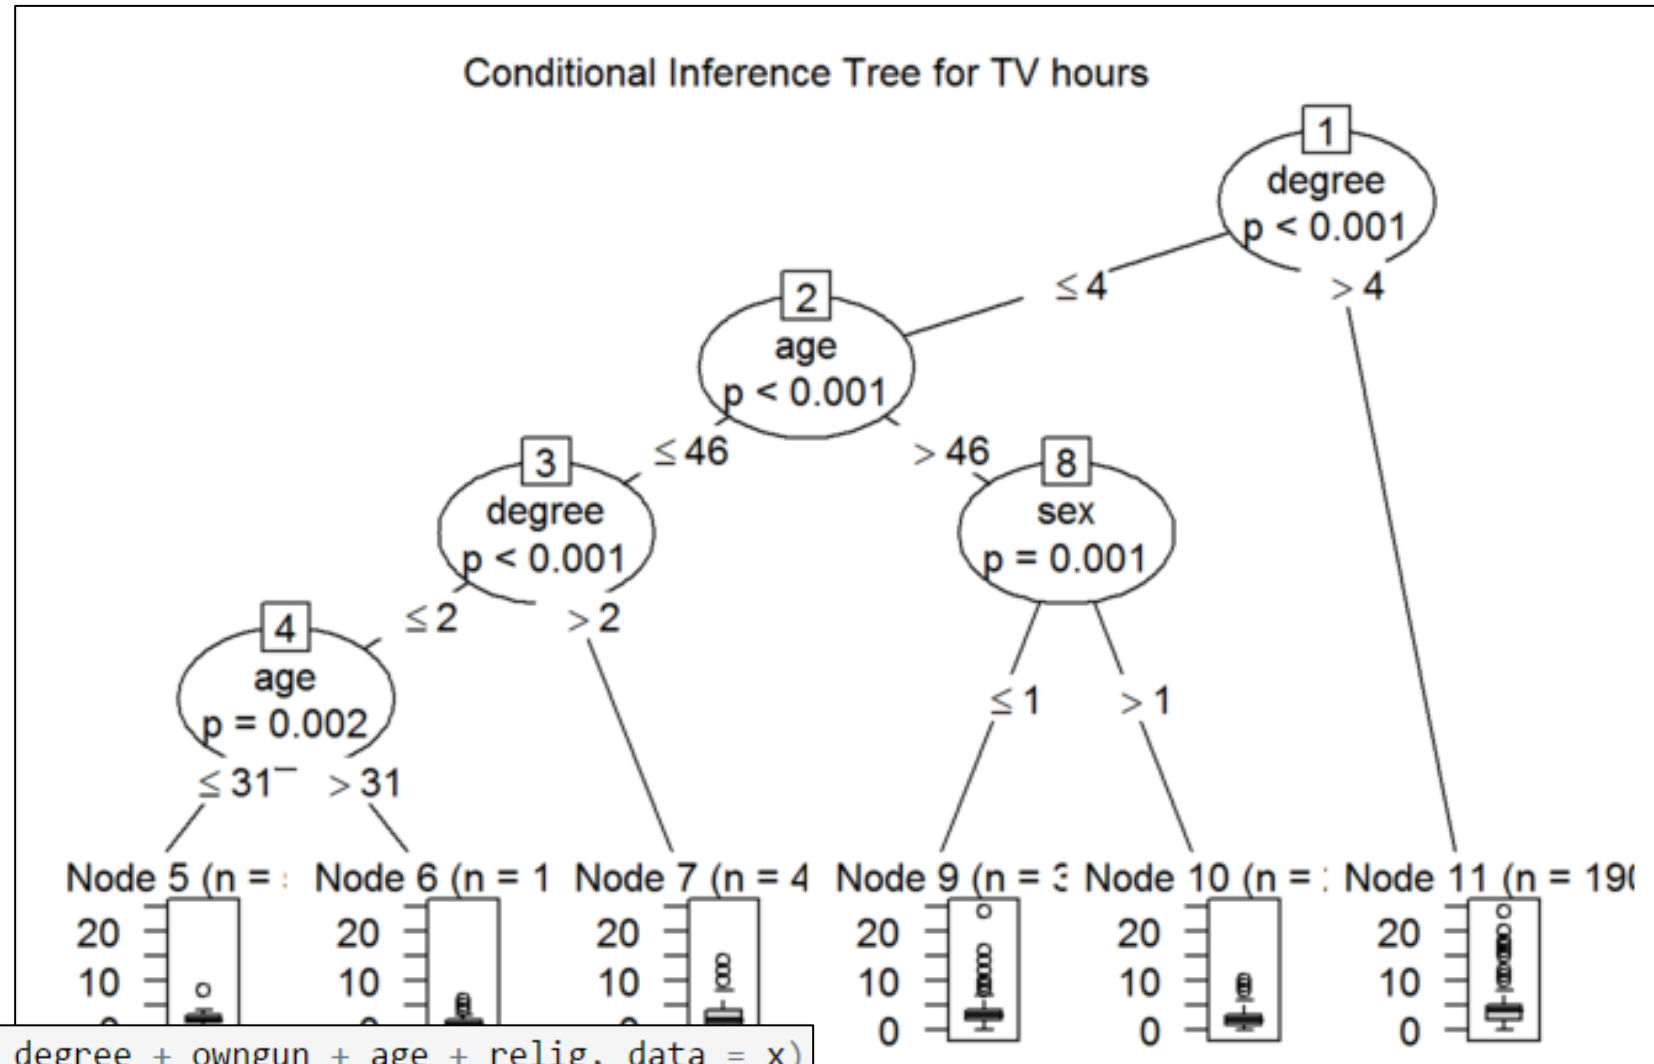

- Uses the standard formula call
 - Specify number of factors and rotation
- Can plot from there
- And the resulting object retains p-values, loadings, etc...

```
x <- data.frame(lapply(
fan <- factanal(~sex +
tvhours, data = x,
print(fan, digits = 2,
Call:
factanal(x = ~sex + ra
s, factors = 3, data =
Uniquenesses:
  sex    race  polp
  0.92   0.59
tvhours
  0.65
Loadings:
      Factor1 Facto
race   -0.53
tvhours 0.55
fan$loadings
Loadings:
      Factor1 Factor2 Factor3
sex           0.277
race   -0.530  0.239  0.270
polparty -0.211  0.294
degree    0.450
relig                0.150
age                0.630
owngun           0.453  0.342
gunlaw           0.564
tvhours    0.547                0.215
SS loadings      0.841  0.752  0.661
Proportion Var   0.093  0.084  0.073
Cumulative Var   0.093  0.177  0.251
owngun + gunlaw +
owngun + gunlaw + tvh
gunlaw
  0.68
```

(There are also packages for Structural Equation Modeling)

Tree models

- Via “rpart”, “party”, “randomForest”
 1. Grow a tree
 2. Visualize results
 3. Prune

```
fit <- ctree(tvhours ~ sex + polparty + degree + owngun + age + relig, data = x)
plot(fit, main = "Conditional Inference Tree for TV hours")
```

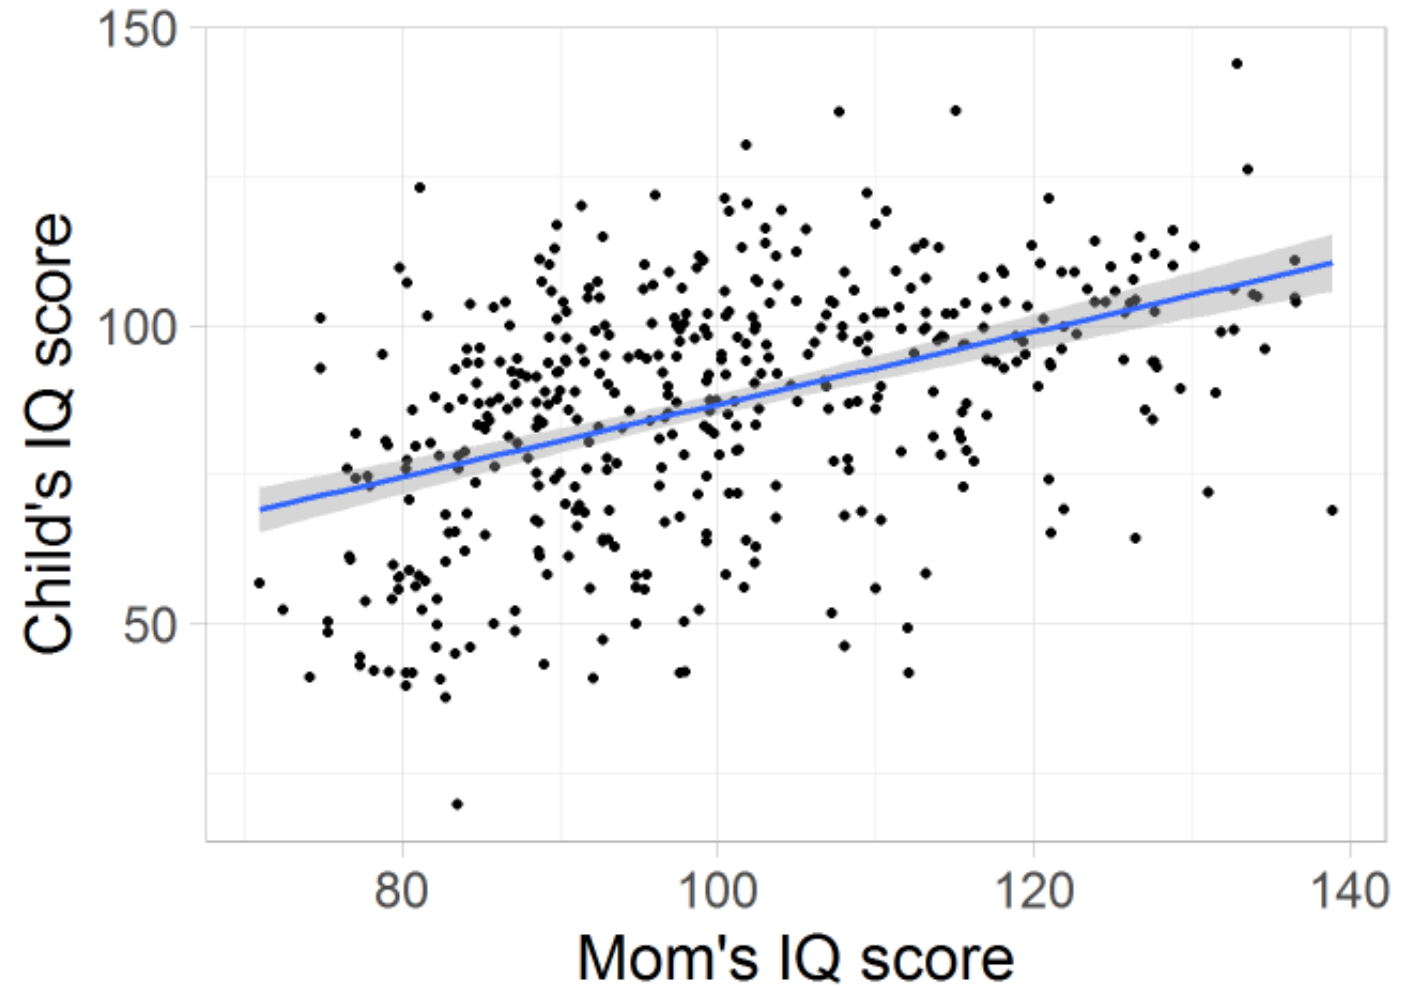

Regression

Data: child IQ measures

```
fit01 <- lm(kid_score ~ mom_iq, data = iq)
```

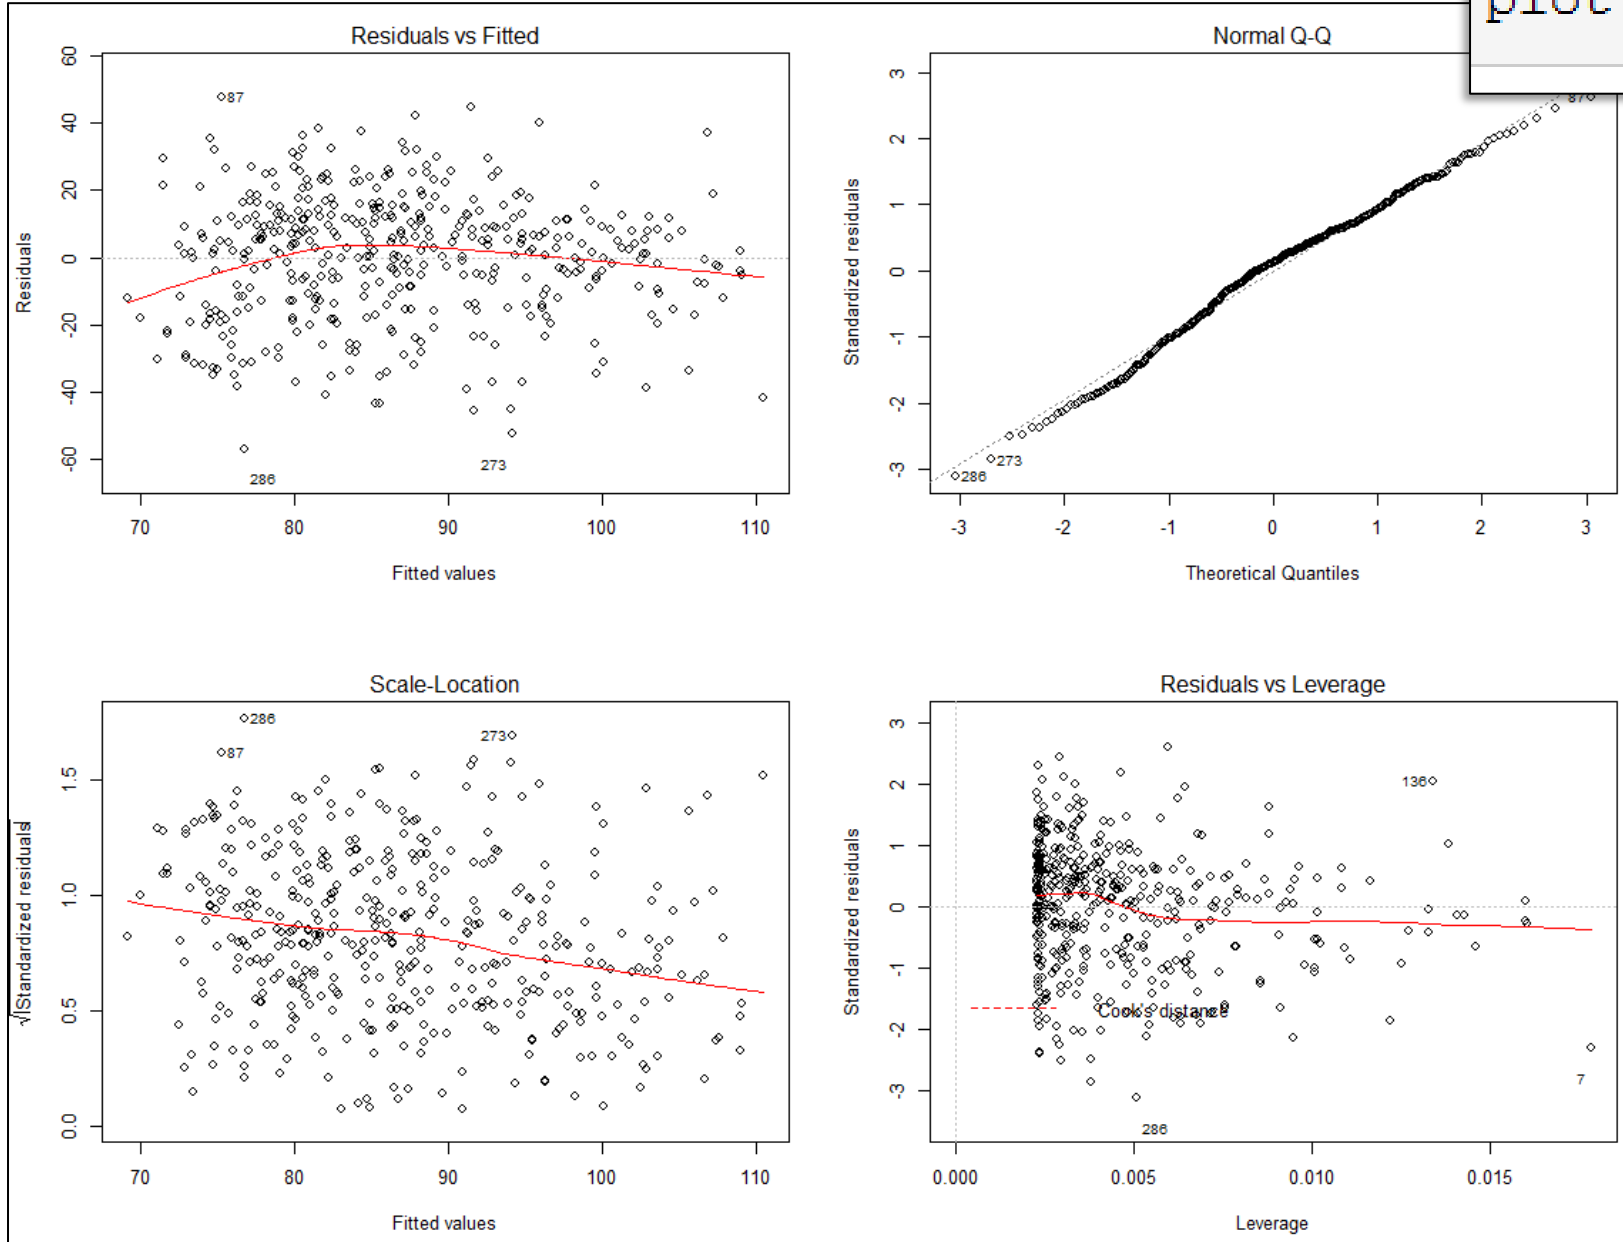

My Model

	<i>Dependent variable:</i>
	kid_score
	Child's Score
Mom's Score	0.610 ^{***} (0.059)
Intercept	25.800 ^{***} (5.920)
Observations	434
R ²	0.201
Adjusted R ²	0.199
Residual Std. Error	18.300 (df = 432)
F Statistic	109.000 ^{***} (df = 1; 432)
Note:	<i>p</i> <0.1; <i>p</i> <0.05; <i>p</i> <0.01

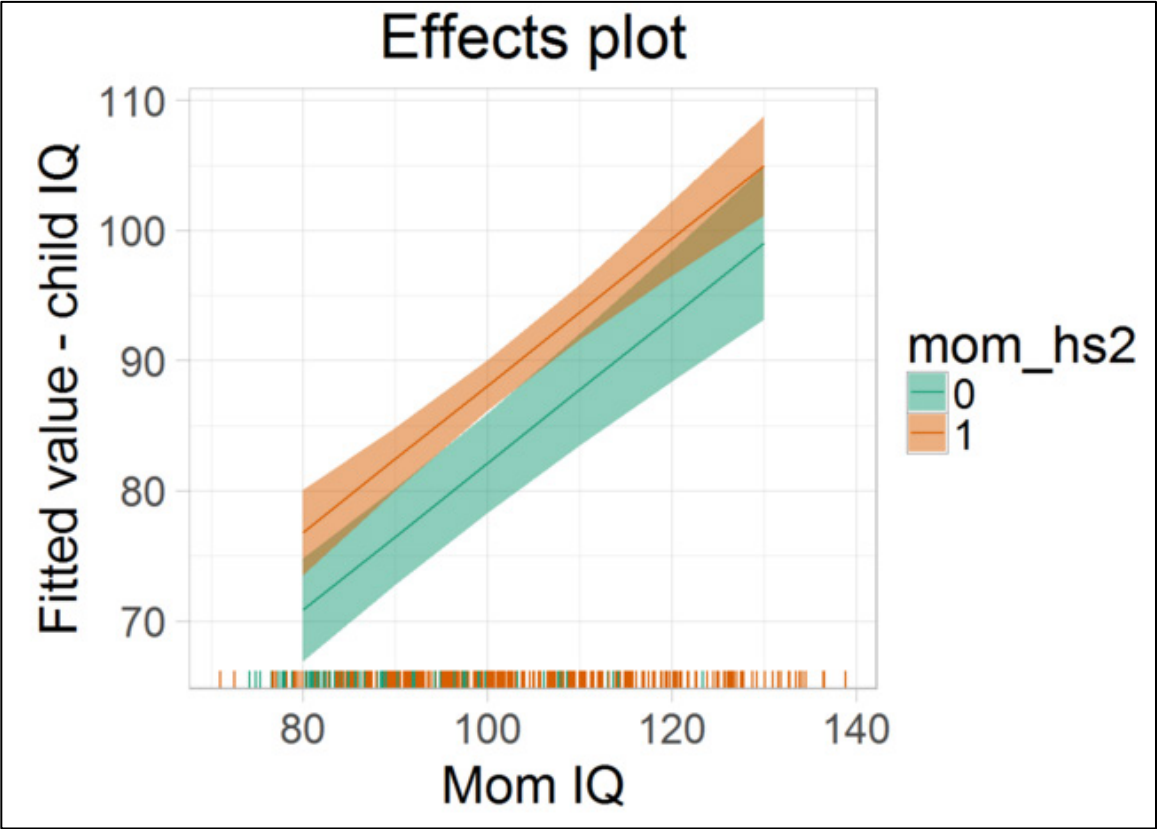

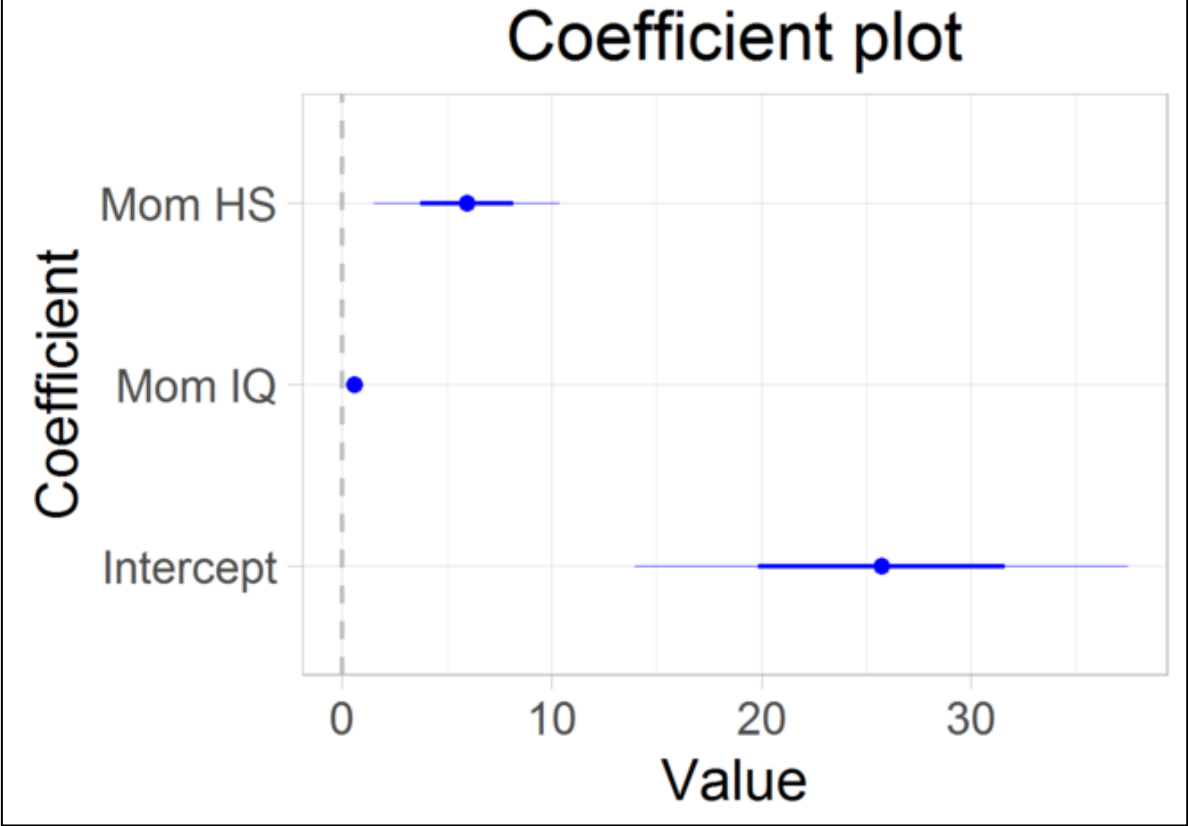

Model Diagnostics

```
plot(fit01)
```

Additional post-estimation plots

Logistic regression (and other GLMs)

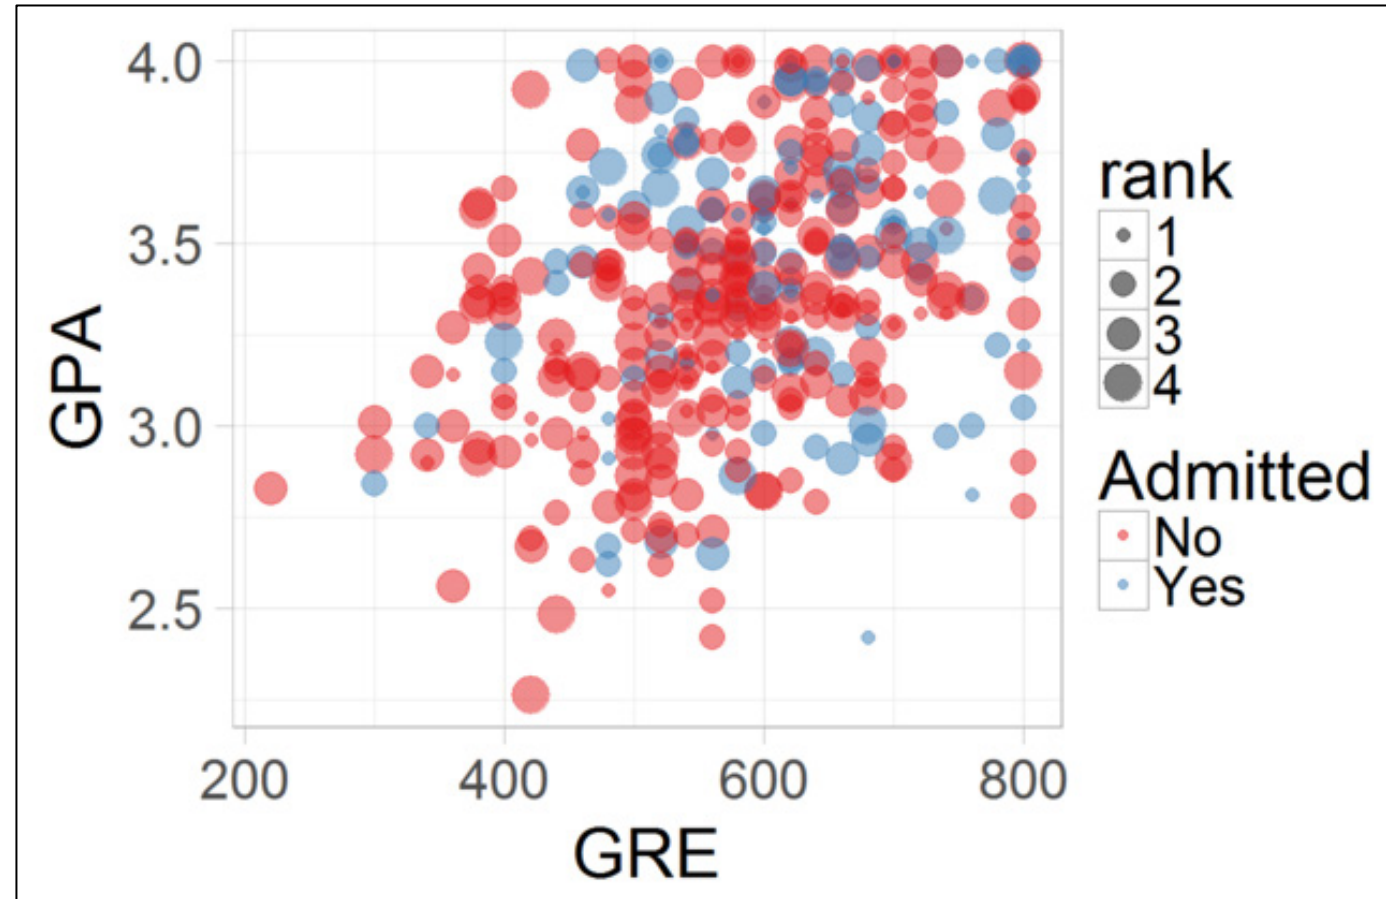

- ...Are also easily implemented
- Example: graduate school admissions

```
head(mydata)
```

	admit	gre	gpa	rank
1	0	380	3.61	3
2	1	660	3.67	3
3	1	800	4.00	1
4	1	640	3.19	4
5	0	520	2.93	4
6	1	760	3.00	2

```
xtabs(~admit + rank
```

	rank			
admit	1	2	3	4
0	28	97	93	55
1	33	54	28	12

GLM, cont.

```
>> mylogit <- glm(admit ~ gre + gpa + rank,
family = "binomial")
```

```
confint(mylogit)
```

	2.5 %	97.5 %
(Intercept)	-6.271620	-1.79255
gre	0.000138	0.00444
gpa	0.160296	1.46414
rank2	-1.300889	-0.05675
rank3	-2.027671	-0.67037
rank4	-2.400027	-0.75354

```
exp(cbind(OR = coef(mylogit), confint(mylogit)))
```

	OR	2.5 %	97.5 %
(Intercept)	0.0185	0.00189	0.167

```
(Dispersion parameter for binomial family taken to be 1)
```

```
Null deviance: 499.98 on 399 degrees of freedom
Residual deviance: 458.52 on 394 degrees of freedom
AIC: 470.5
```

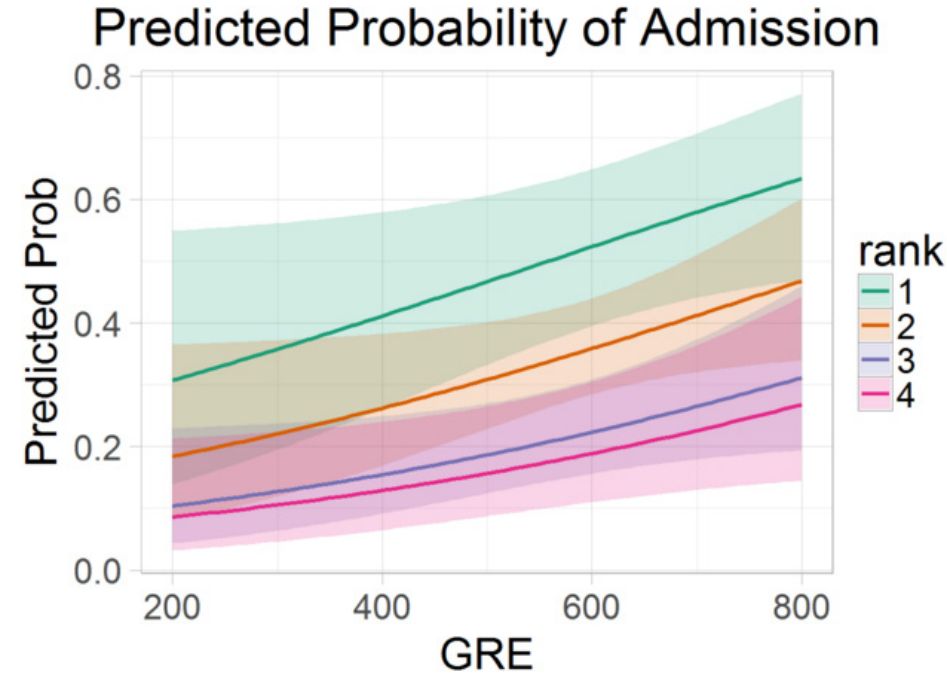

```
Number of Fisher Scoring iterations: 4
```

GLM, cont.

Grad School Admission Model

	Admitted
GRE	0.002** (0.001)
GPA	0.804** (0.332)
Rank=2	-0.675** (0.316)
Rank=3	-1.340*** (0.345)
Rank=4	-1.550*** (0.418)
Constant	-3.990*** (1.140)
N	400
Log Likelihood	-229.000
AIC	471.000

Note: $p < .01$; $p < .05$; $p < .1$
Rank = 1 omitted

Forecasting and prediction

```
>> ggtsdisplay(USAccDeaths, plot.type = "scatter")
```

- Methods for time series as well as statistical models
- Seasonal decomposition, exponential smoothing
- Linear forecasts, MCMC, etc...

Data: US Accident deaths

Forecasting, prediction, time series

```
dp <- decompose(USAccDeaths)
autoplot(dp) + theme_light(base_size = 22)
```

```
fit <- auto.arima(USAccDeaths)
autoplot(forecast(fit, h = 5))
```

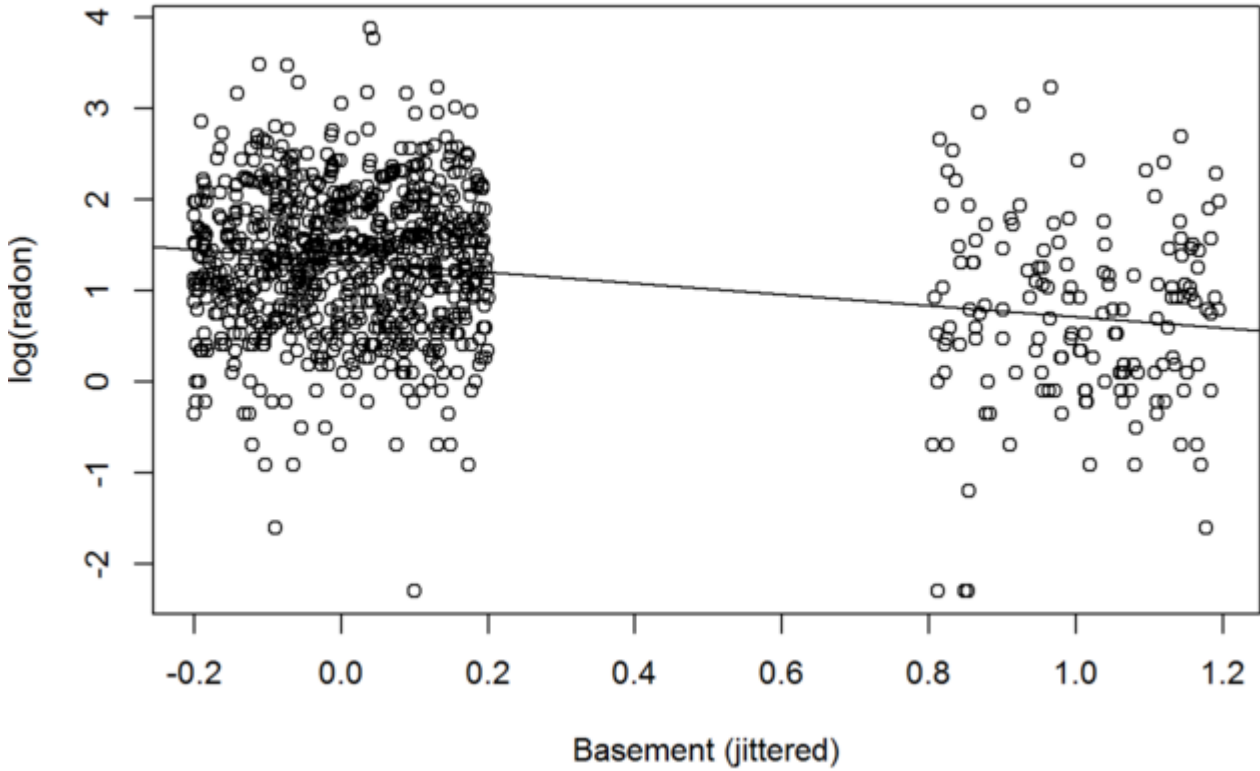

Hierarchical models (or nested, multilevel, etc...)

- MN radon data
 - Measurements are nested within 85 counties
 - Number of samples per county vary widely
 - Can model with varying slopes, intercepts, both

	log(radon)			
	OLS	linear mixed-effects		
	OLS	Varying interceptsW/ group-level predictor	Varying slopes and intercepts	
x	-0.613 ^{***} (0.073)	-0.693 ^{***} (0.070)	-0.668 ^{***} (0.069)	-0.671 ^{***} (0.084)
u.full			0.720 ^{***} (0.092)	0.808 ^{***} (0.091)
x:u.full				-0.420 [*] (0.227)
Constant	1.330 ^{***} (0.030)	1.460 ^{***} (0.052)	1.470 ^{***} (0.038)	1.470 ^{***} (0.035)

Note:	p < .01; p < .05; p < .1			

HLM example, cont.

OLS plot of $y \sim x$

Variation across counties
(means and standard deviations)

Perhaps try allowing county intercepts to vary

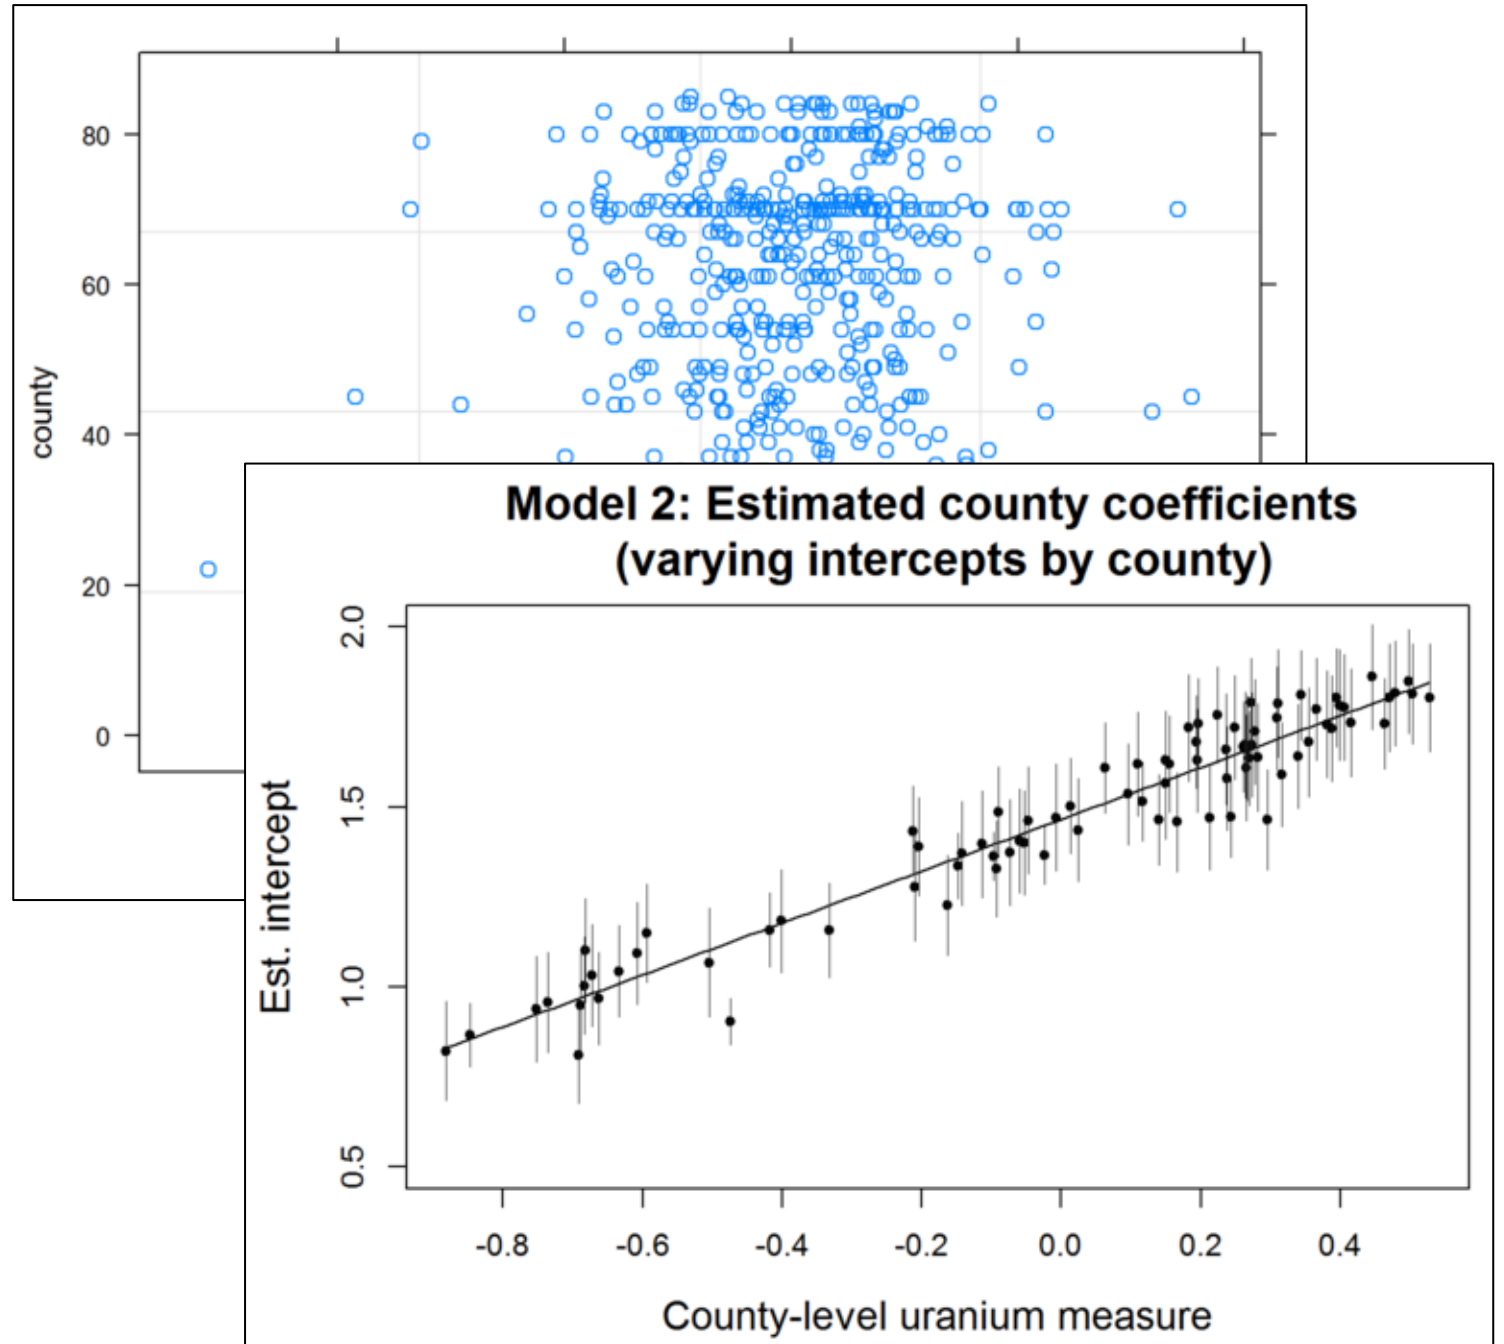

HLM example, cont.

- After running model, extract random effects from the fitted object

```
ranef(M2)
```

\$county	
(Intercept)	
1	-0.020642
2	0.011246
3	0.012422
4	0.111128
5	0.008236

- And examine the county-level residuals
- Or plot the individual county intercepts

Network analysis

R has an expanding library of network analysis tools

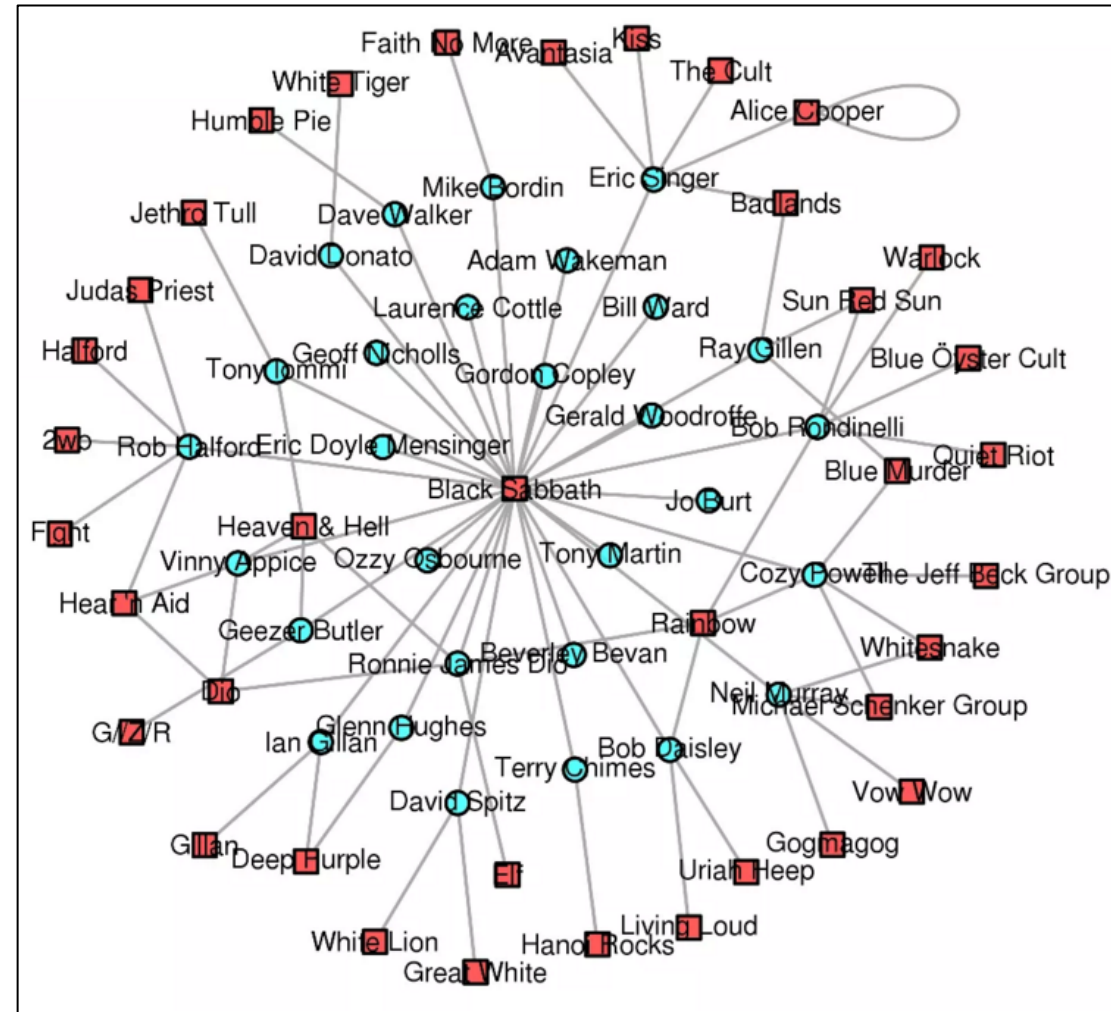

- Descriptive statistics
- Exponential Random Graph Modeling for inferential models
- Visualizations

Co-occurrence network of country names in statements by US senators

(Katherine Ognyanova, kateto.net/countries)

Black Sabbath ego network

<http://www.r-bloggers.com/patterns-in-the-ivy-the-small-world-of-metal/>

SNA example: simulated disease spread

- Simulation
- Temporal network
 - Red = infected
 - Blue = not yet infected

toy_epi_sim network at t=1

toy_epi_sim network at=17

toy_epi_sim network at t=25

Mapping

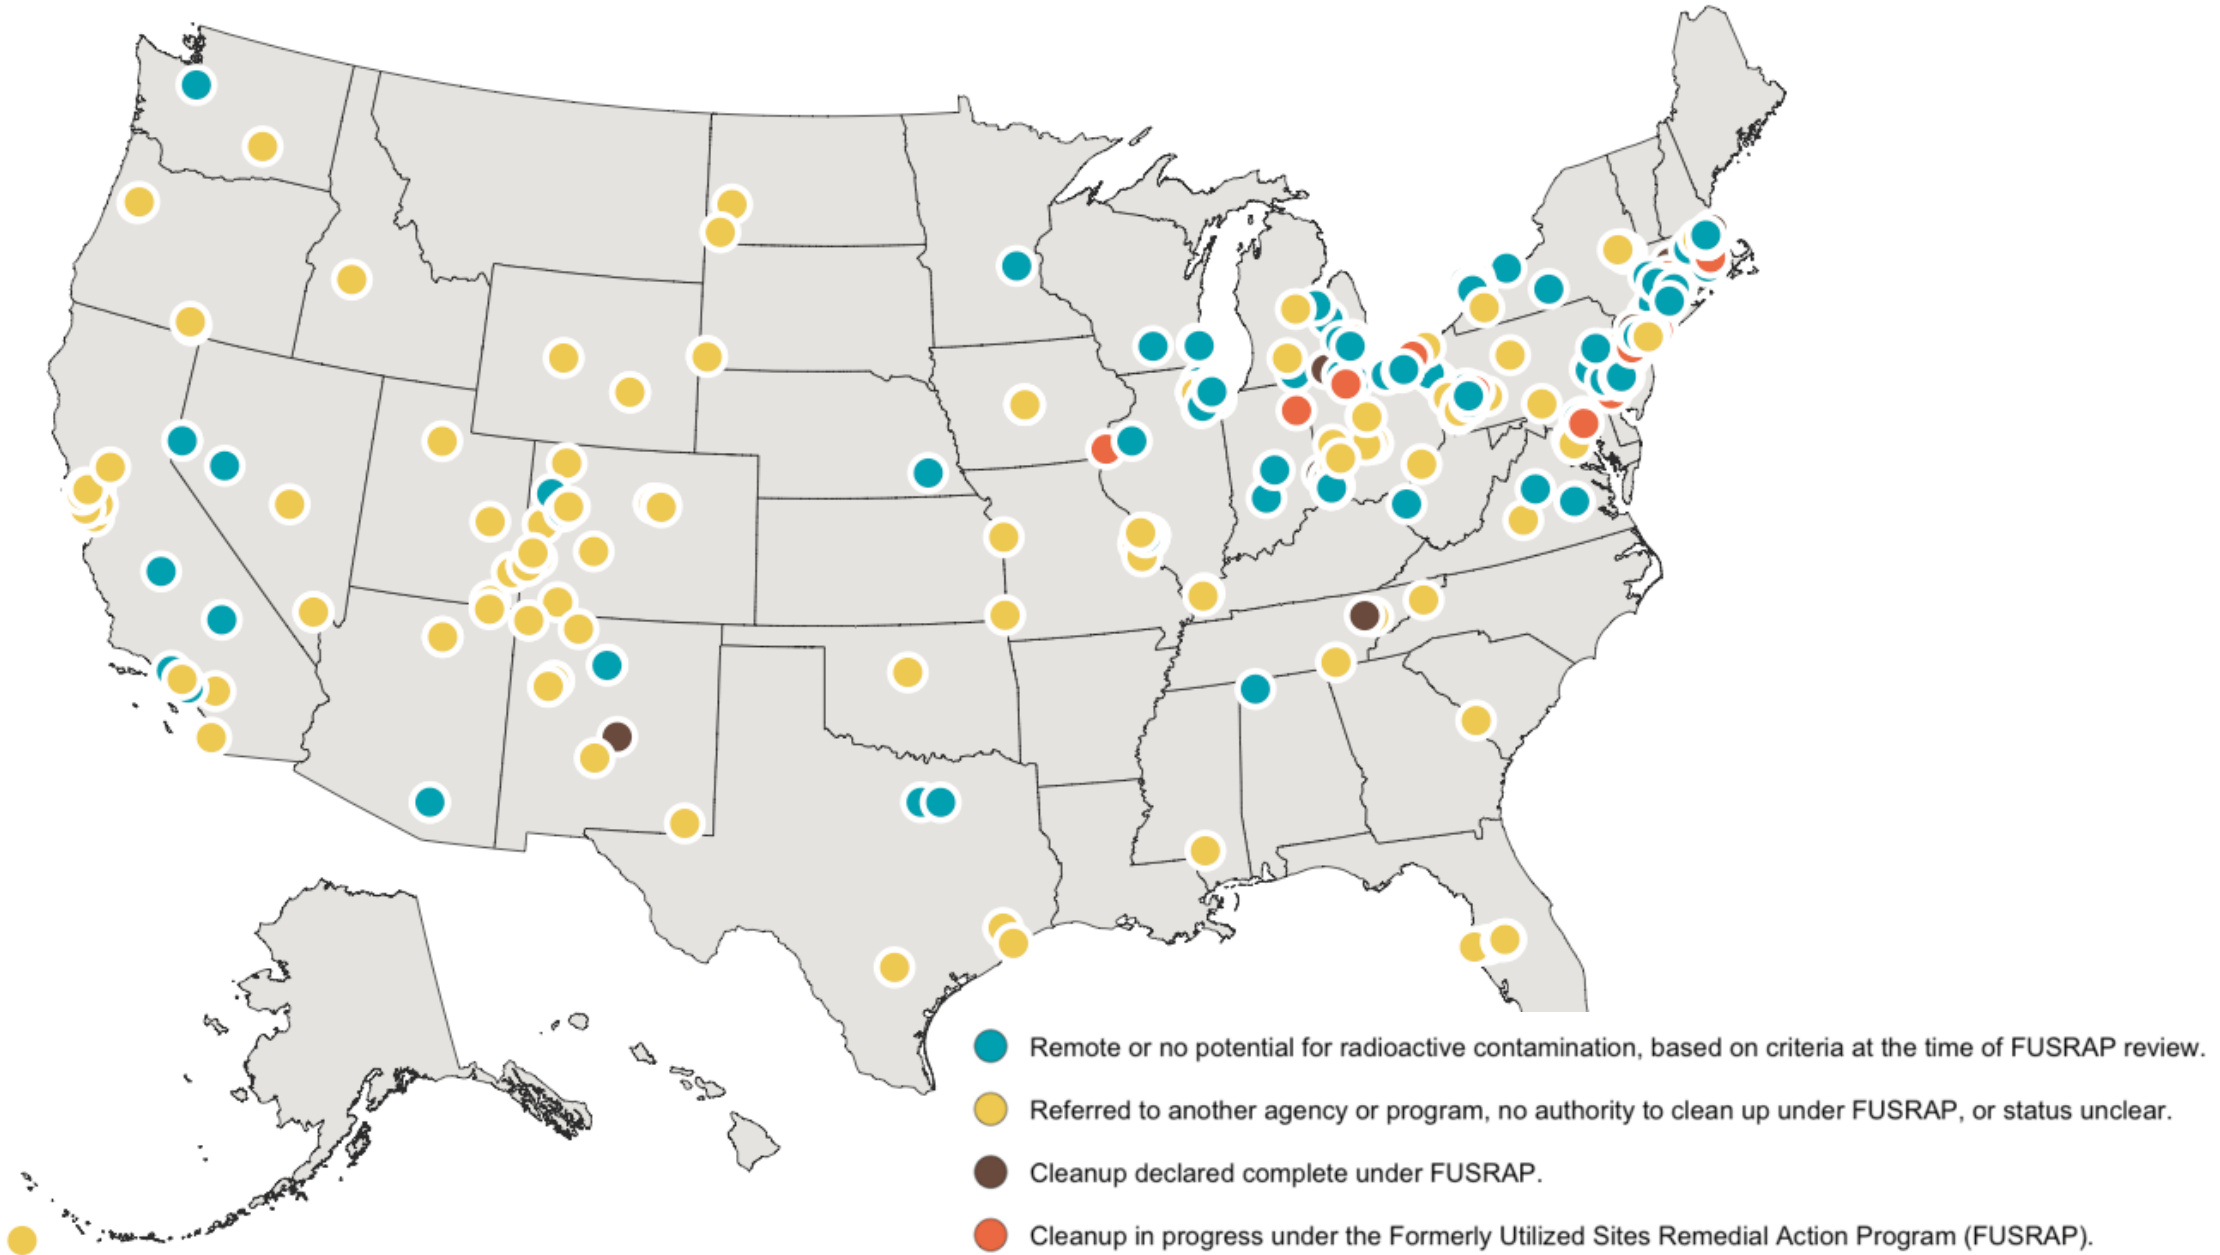

Google style

Base R

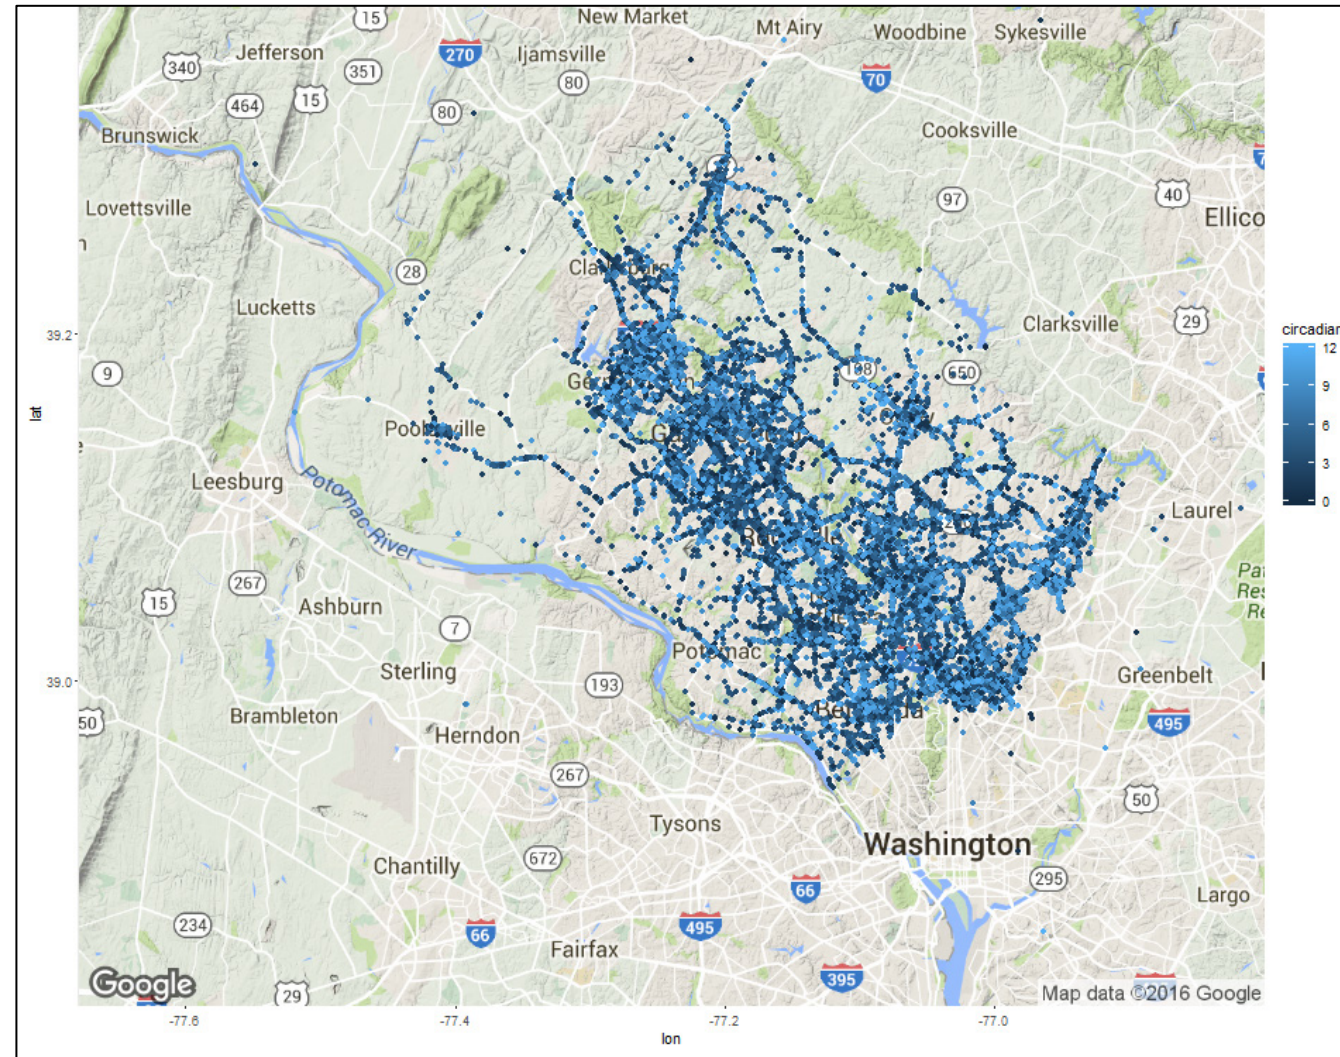

Waste Lands: America's Forgotten Nuclear Legacy

Washington Post

Integrate with data systems

- Download 800k records of Montgomery Co traffic violations
- Stored in a relational database
- Connect to database within R, query using SQL syntax
- Visualize with a Google Maps-style plot

Traffic violations (shade = time of day)

Putting it together

- R is a language
 - And a large analytical toolbox
- Best-use leverages multiple strengths
 - Use an IDE;
 - Create readable, reproducible code chunks;
 - Use markdown to author reports and presentations
 - (almost) all of the code for this presentation was created with markdown -> HTML output

```
149 # detach("package:xtable", unload=TRUE)
150 ` ` `
151
152 A formula looks like this:
153
154 $$
155 \huge{Y \sim Var_1 + Var_2 + \dotso}
156 $$
157
158 ### Factor analysis
159 ` ` `{r factor_analysis, compress=TRUE}
160 # First I need to convert the factor variables to numeric
161 x <- data.frame(lapply(gss08[,names(gss08)], function(x) a
162
```

A formula looks like this:

$$Y \sim Var_1 + Var_2 + \dots$$

Factor analysis

```
>> # First I need to convert the factor variables to numeric
>> x <- data.frame(lapply(gss08[, names(gss08)], function(x)
```
